DICTYOPHARIDAE

INTRODUCTION

The present catalogue of the Family Dictyopharidae forms Part 8 of Fascicle IV of the General Catalogue of the Hemiptera of the World, which is devoted to the Superfamily Fulgoroidea.

CHARACTERS OF THE FAMILY DICTYOPHARIDAE

The Family Dictyopharidae is one of the larger families of the Fulgoroidea. The present catalogue contains 119 genera and 489 species. Most of the species are medium sized fulgoroids with strongly modified heads.

The head is proportionately large, frequently with a distinct cephalic process which may be conically or teretely produced. In other genera the head is not produced in front of the compound eyes, and the vertex rounds into the frons sometimes with and sometimes without a transverse carina separating the one from the other. The vertex is usually broader than the short diameter of the compound eyes; sometimes with, but more frequently without, a median carina. The frons is usually elongate, with strong median, lateral, and intermediate carinae; although any of these may be wanting. The compound eyes are usually semiglobose with the sinus wanting or inconspicuous. The antennae are usually small and inconspicuous; the first segment collar-like; the second usually globose or obovate; the flagellum moderately elongate. The paired lateral ocelli are usually present and are situated on the lateral area of the head in front of the compound eyes, or sometimes below the eyes.

The thorax is conspicuous, with the pronotum and mesonotum sometimes subequal in length and breadth. Frequently the pronotum is short, broad, and collar-like. Quite frequently it has median and intermediate carinae, with two conspicuous lateral carinae behind the compound eyes. The mesonotum is sometimes rhomboidal in outline, with the anterior margin triangularly produced. The tegulae are usually large, frequently carinate. In the subfamily Orgeriinae the tegulae are absent. The legs are usually slender and elongate; but in some genera the fore femora or tibiae or both (*Phylloscelis* Germ.) may be greatly expanded. The hind tibiae generally bear three or five stout spines. Second segment of hind tarsi large, with a row of small, stout spines at the apex.

Tegmina macropterous or brachypterous. Rarely both long and short winged forms are found in the same genus (*Scolops* Schaum, *Phylloscelis* Germ.). The members of the subfamily Orgeriinae are all brachypterous and lack the claval suture usually characteristic of homopterous tegmina. The venation of the macropterous tegmina is of a fairly constant pattern and

may be described briefly as follows: Subcosta and radius united to near the apical third, where subcosta curves toward the costal border and forms a distinct nodal cell which is usually crossed by several branches of subcosta. After the separation from subcosta, radius usually branches irregularly and is united to the first branch of media by one or more cross veins. In many species there is an irregular series of cross veins on the apical third, forming a transverse vein similar to the transverse vein found in the family Tropiciduchidae, and for this reason there has been considerable confusion in placing certain genera and species in these two families. However, the two families may be separated readily by the character of the second segment of the hind tarsi which is large in the members of the family Dictyopharidae and small in the species in the family Tropiciduchidae. Media and cubitus fork before the transverse vein in many species of Dictyopharidae and the apical area usually has numerous irregular cross veins. In the species with brachypterous tegmina the venation is very irregular and variable.

The hind wings are large in most macropterous forms, with the venation somewhat irregular and with usually numerous cross veins in the apical area but not in the anal area. This character will aid in differentiating certain members of this family from species of the family Fulgoridae, with which they might otherwise be confused. Hind wings are frequently absent in brachypterous forms.

The male genitalia are complex. Muir (1930) says, "There is an inner penis and an outer perianthrium, and the membrane connecting them can be protruded and inflated, and is complex, often bearing armatures."

CLASSIFICATION ADOPTED

The classification adopted in the present catalogue is a modification of the one proposed by Melichar in 1912.

- Family **DICTYOPHARIDAE**
- Subfamily **DICTYOPHARINAE**
- Tribe **DICHOPTERINI**
- Subtribe **CLADODIPTERINA**
- Subtribe **DICHOPTERINA**
- Tribe **DICTYOPHARINI**
- Subfamily **ORGERIINAE**
- Tribe **LYNCIDINI**
- Tribe **ORGERIINI**

HISTORICAL RÉSUMÉ

The first species recognized in this family was *Dictyophara europaea*, described by Linné in 1767 as *Fulgora europaea*. Other species at present

placed in this family were added by the earlier European systematic entomologists. Although the genus *Dictyophara* Germar was not described until 1833, Spinola in 1839 recognized that this genus together with the new genera *Plegmatoptera* and *Dichoptera* constituted a distinct subfamily. Also included in this subfamily were the genera *Monopsis* Spin. and *Elidiptera* Spin. at present placed in the families Tropicuchidae and Achilidae respectively. During the middle of the nineteenth century Stål and Walker added many new genera and species to this group. Later in the nineteenth century and the early part of the twentieth century many contributions were made by Ball, de Bergevin, Fennah, Jacobi, Kirkaldy, Kusnezov, Muir, Osborn, Oshanin, Schmidt, Uhler, Van Duzee, and others. But Melichar's *Monographie der Dictyophorinen* (1912) remains the greatest single contribution that has been made to the study of these insects up to the present time.

GEOGRAPHICAL DISTRIBUTION

The species of this family are widely distributed in all parts of the world save the extreme Arctic and Antarctic regions. This family reaches its greatest development, however, in the tropical regions of the world. The family seems to be especially well developed in South America, the Oriental Region and the East Indies. Many species are confined to the arid and semiarid regions of the world where they seem to be very local in their distribution and often confined to a single host plant. The faunas of North America, Central America, Japan and India are fairly well known, but vast regions of the world have hardly been explored. The geographic distribution of each species is indicated by superscript figures at the end of the lines, which correspond to geographic regions designated by the same superscript figures. In general we have indicated the distribution as given by the author of the reference, using the country as the smallest unit except in the larger countries, where states and provinces are used as the smallest units. In the larger island groups the individual islands are indicated wherever possible, in view of the importance of island endemism.

FORM OF THE PRESENT CATALOGUE

This catalogue follows the general form of the present series. The family is divided into subfamilies and tribes, and the genera are arranged under each category in as nearly a phylogenetic order as our present knowledge will permit. The species are arranged under the genera in alphabetic sequence. Titles of books are not abbreviated but are condensed if they are unduly long. The abbreviations of journal references follow in general the scheme proposed in the *World List of Scientific Periodicals* with minor exceptions, the chief difference being that the names of countries, states, cities and other geographical units are not abbreviated. A few references

are listed under their titles rather than under the abbreviations of the journals in which they were published, because in these cases the titles are usually better known than the journals, for example, Van Duzee 1917 Catalogue of Hemiptera of America North of Mexico, *not* Techn. Bull. California Agr. Exp. Sta. Ent. 2. If the journal has been published in series the abbreviation of the journal is followed by a series number or by such an abbreviation as n. s. (new series), o. s. (old series), n. f. (neue Folge), or the like. This is followed by a note indicating the nature of the reference.

The notes which follow the references are generally self explanatory, but three points may be mentioned here. Such notations as "[described]," "[notes]," "[key]," and the like are intended to be suggestive rather than precise or exclusive. The notation "[error]" means not accepted in this catalogue. Usually the latest published synonymy is accepted, but not always. The other notation "[comparative note]" is used to designate those references, often of the greatest taxonomic significance, in which two generic, specific or other groups are compared. All references have been checked against the original save those marked with an asterisk (*), which have been accepted from reliable sources. Every effort has been made to have the references full and complete and to give an indication of the character of the data contained. Where the writer knows that reprints have been issued with different pagination, this is indicated in parenthesis following the page numbers of the original. In a few cases, where the matter has been reprinted under a different title with different pagination, separate references are given. Where authentic editions have been published, these have been indicated by separate references. Genera established without included species have been dated from their original description, with their type fixation dated at the time of the first inclusion of species. Original spellings have been retained in all cases, except obvious typographical errors. Typographical errors are indicated by placing "[sic]" after the misspelled name. All typographical errors, save those which refer to endings only, are appropriately cross-referred. The species have also been listed under every known combination so that it is possible to find any species without recourse to the index, which will be published at the completion of the Fascicle, together with the full bibliography. In the meantime persons interested in full bibliography may consult the author's Bibliography of the Homoptera (1945).

A catalogue is not a revision of a group, and the location of the genera and species in the present catalogue is merely an attempt to reflect what is believed to be the general consensus of the best authorities at the present time. Doubtful genera and species have been included to call them to the attention of subsequent revisers.

An attempt has been made throughout this catalogue to interpret all references in the light of the period in which they were published. This is

not always easy and leads perhaps to erroneous conclusions at times, but it is certainly much sounder from the standpoint of nomenclature than the tendency to evaluate references from previous decades in the light of present day practices and procedures.

Under the family, subfamily and tribal categories we have attempted to include those references which we believe belong in the respective categories regardless of the designation given by the author. Thus, a reference to the tribe DICTYOPHARINI may be included in the family DICTYOPHARIDAE, in the subfamily DICTYOPHARINAE or in the tribe DICTYOPHARINI, depending on the implication of the author with reference to the classification adopted in the present catalogue. All categories of less than specific value are included under the designation variety. Varieties which have been given alphabetic designations are here given latinized names for convenience in determining their true status.
